

Build a Professional Web App

with 4 free tools — no code, no experience needed

You don't have to be a developer. These four free tools, plus AI, do the heavy lifting. This is the exact stack — follow it top to bottom and you'll have a real app, live on the internet.

1

Claude Code

Install the AI that writes all your code for you, from plain English. It's the brain of the whole build — you describe what you want, it builds it.

2

SkillUI

Found a website whose look you love? Point SkillUI at it. It reverse-engineers the entire design system into a file Claude builds from — so your app looks pro, never “AI-generated.”

```
npm install skillui --url https://the-site-you-love.com --mode ultra
```

3

Supabase

Add a real backend — user logins and a database — completely free. Claude wires it into your app for you.

4

Vercel

Push your finished app live to a real URL in seconds. Also free. Now anyone on the internet can use it.

» PUT IT TOGETHER

Open the SkillUI folder in Claude Code and say: “Build me [my app] with Supabase logins and a database,” then “Deploy it to Vercel.” That's the whole workflow.

Now turn it into recurring income.

Building the app is just the start. Inside **Leveraging AI**, you learn to build apps people subscribe to — so one build pays you every single month. Come build your first one with me.
